May 2010

The Fishery Management Reports series was established in 1989 by the Division of Sport Fish for the publication of an overview of management activities and goals in a specific geographic area, and became a joint divisional series in 2004 with the Division of Commercial Fisheries. Fishery Management Reports are intended for fishery and other technical professionals, as well as lay persons. Fishery Management Reports are available through the Alaska State Library and on the Internet: <http://www.sf.adfg.state.ak.us/statewide/divreports/html/intersearch.cfm>. This publication has undergone regional peer review.

ABSTRACT

The 2009 commercial salmon harvest in the Aleutian Islands Management Area (AIMA) consisted primarily of 1,625,910 pink salmon, *Oncorhynchus gorbuscha*. The entire 2009 AIMA harvest occurred around the island of Unalaska. Only five years (2000 and 2006 through 2009) have had a commercial salmon harvest in the AIMA since 1995. No commercial salmon fishing has occurred in the Atka-Amlia Islands Management Area since 1996.

Subsistence salmon harvest information is compiled from permits that are returned when subsistence fishing activities are completed. In 2009, the estimated Unalaska District subsistence salmon harvest was 5 Chinook *O. tshawytscha* salmon, 3,262 sockeye *O. nerka* salmon, 620 coho *O. kisutch* salmon, 444 pink salmon, and 182 chum *O. keta* salmon. The Adak District estimated subsistence harvest was 25 sockeye salmon in 2009, which was the lowest recorded harvest of sockeye salmon in this area.

Salmon escapement information for the AIMA and Atka-Amlia Islands Management Areas is sporadically collected. Salmon enumeration weirs have been operated at Summer Bay Lake (1998-2001) and McLees Lake (2001-present) on Unalaska Island to assess salmon escapement. In 2009, 10,120 sockeye salmon were counted at the McLees Lake weir whereas in 2003, 101,793 sockeye salmon were counted. One day of aerial survey work was conducted in 2009 and an estimated 160,000 pink salmon were documented in nine Unalaska Island streams. Foot surveys of Unalaska road-system streams were not conducted in 2009.

Key words: Aleutian Islands, Atka-Amlia Islands, annual management report, commercial salmon harvest, subsistence salmon harvest, Chinook salmon, *Oncorhynchus tshawytscha*, sockeye salmon, *Oncorhynchus nerka*, coho salmon, *Oncorhynchus kisutch*, pink salmon, *Oncorhynchus gorbuscha*, chum salmon, *Oncorhynchus keta*, sustainable escapement goal, AMR, SEG.

INTRODUCTION

The Aleutian Islands Management Area includes the State waters west of Cape Sarichef Light and Scotch Cap (both located on Unimak Island), and the Pribilof Islands, but excludes the Atka-Amlia Islands Management Area (5 AAC 12.100; Figure 1). The Atka-Amlia Islands Management Area encompasses all Aleutian Islands waters between Segum Pass (172° 50.00' W. long.) and Atka Pass (175° 23.00' W. long.; 5 AAC 11.101; Figure 2). The Alaska Department of Fish and Game (ADF&G) has been responsible for managing the salmon resources of the Aleutian Islands and Atka-Amlia Islands Management areas since 1960. In this report we present commercial and subsistence salmon harvest and escapement information for these areas.

The Aleutian Islands Management Area is part of the Alaska Peninsula Salmon Management Area (Area M). Purse seines, hand purse seines, and beach seines are the only legal gear types allowed to fish for salmon in the Aleutian Islands Area (5 AAC 12.330).

The Alaska Board of Fisheries (BOF) created the Atka-Amlia Islands Management Area (Area F) in 1992 to provide a harvest opportunity for local fishermen on local area pink salmon *Oncorhynchus gorbuscha* runs. Legal harvest methods for the Atka-Amlia Islands Management Area include both set gillnetting and purse seining (5 AAC 11.333). To date, only set gillnet fishermen have reported commercial salmon harvests from the Atka-Amlia Islands Area (Shaul and Dinnocenzo 2004). Area M Commercial Fisheries Entry Commission (CFEC) permits are also valid in Area F.

COMMERCIAL SALMON FISHING

Runs of sockeye *Oncorhynchus nerka*, coho *O. kisutch*, pink, and chum *O. keta* salmon occur in Aleutian Islands streams; however, poor salmon markets have generally limited commercial salmon harvests in both the Unalaska Island and Atka-Amlia Island fisheries. Pink salmon are the dominant species in the Aleutian Islands, and runs tend to be stronger during even-numbered years (Shaul and Dinnocenzo 2004). Aleutian Islands harvest data from 1928-1950 cannot be separated from Alaska Peninsula salmon harvests, because the total number of fish harvested was estimated from the number of cases of salmon canned for both areas. There was occasional fishing near Umnak Island during the 1950s and early 1960s, and a fishing expedition to Attu Island in 1963 (Figure 1; Shaul and Dinnocenzo 2004). Prior to 1979, fishermen salted and sold some fish (usually sockeye salmon). Processors in Unalaska-Dutch

Harbor or Akutan purchased most of the commercially harvested salmon from 1979 through 1988. Because of the decline in demand for pink salmon after 1988, processing facilities in Dutch Harbor did not purchase salmon and any harvest was transported to the Alaska Peninsula for processing. Since 2006, markets have developed for pink salmon, creating a renewed interest in the Aleutian Islands salmon runs. In 2009, portions of the harvest were processed in King Cove, Sand Point, Akutan, and Dutch Harbor.

Historically there was little commercial harvest during odd-numbered years in the Aleutian Islands Area. Odd-year average pink salmon harvest for 1989-2007 was 102,386 fish (only 1989 and 2007 had harvest) while the even-year average harvest for 1990-2008 was 348,625 fish (Table 1). The largest Aleutian Islands Area pink salmon harvest of 2,597,461 fish was in 1980. Of these, approximately 2.0 million pink salmon were harvested in the Makushin Bay Section (Figure 3). Since 1995, only five years (2000 and 2006 through 2009) have had a commercial salmon fishery take place in the Aleutian Islands Area and all of the commercial harvest has occurred around Unalaska Island (Table 1).

Small commercial harvests occurred in the Atka-Amlia Islands Management Area between 1992 and 1996 with no commercial effort since that time (Table 2). Interest in this fishery diminished due to lack of markets, high processing costs, and low volumes of fish (Holmes 1997).

SUBSISTENCE SALMON FISHING

Under Alaska state law, subsistence fishing allows the taking of fish by specified means by a resident of the State of Alaska domiciled in a rural area (AS 16.05.940 (31)). Subsistence uses of wild resources are defined as noncommercial, customary, and traditional uses for a variety of purposes (AS 16.05.940 (33)). These include: direct personal or family consumption as food, shelter, fuel, clothing, tools, or transportation, for the making and selling of handicraft articles out of nonedible by-products of fish and wildlife resources taken for personal or family consumption, and for the customary trade, barter, or sharing for personal or family consumption. Whenever it is necessary to restrict harvests, subsistence fisheries have a preference over other uses of the stock (AS 16.05.258(b)).

Personal use fisheries are different from subsistence fisheries because they do not meet the criteria established by the Joint Board of Fisheries and Game for identifying customary and traditional fisheries (5 AAC 99.010), or because they occur within nonsubsistence areas where dependence upon subsistence is not a principle characteristic of the economy, culture, and way of life (AS 16.05.258(c)). Personal use fisheries provide opportunities for harvesting fish with gear other than rod and reel in nonsubsistence areas. However, personal use fisheries are not prioritized over other uses (sport and commercial fisheries) during times of restricted harvest opportunity in the same way that subsistence fisheries are.

Subsistence salmon fishing is important to Aleutian Islands communities (Tables 3 and 4; Veltre and Veltre 1981, 1983). However, due to the remoteness of most villages in the Aleutians Islands Area, subsistence salmon fishing permits are only required in the larger communities in the Unalaska and Adak districts (5 AAC 01.380; Shaul and Dinnocenzo 2005). Subsequently, Unalaska and Adak are the only communities from which subsistence information (from returned permits) is compiled on an annual basis.

Because of a large population increase and an increase in subsistence fishing effort on Unalaska Island in recent years, subsistence restrictions have become necessary to protect salmon stocks in some areas. The number of permits increased from 65 in 1985 to a high of 231 in 2002 (Table 3). Since 2002, the number of permits has fluctuated between a low of 178 (2007) and a high of 227 (2003; Table 3).

Sockeye salmon are the preferred species in the Unalaska subsistence fishery. Most of the sockeye salmon catch in recent years was harvested in Reese Bay, presumably bound for McLees Lake (Figure 4). The estimated Unalaska District average annual sockeye salmon harvest peaked in 2002 at 5,267 fish and has since ranged between 1,722 and 4,844 fish (Table 3).

Unalaska Lake sockeye salmon are important to local residents due to the lake's proximity to the community. Beginning in 1997, the waters closed to subsistence fishing were expanded around the outlet of Unalaska Lake to protect this small stock of sockeye salmon and to increase escapements (5 AAC 01.375).

The BOF eliminated subsistence salmon fishing in the Adak District from 1988 through 1997 and created a personal use salmon fishery for the residents of Adak and Kagalaska islands in response to a large influx of military personnel. After 1993, the personal use effort decreased from previous years due to reductions in U.S. Navy personnel stationed at Adak. Fishing effort in this area declined during 1993-1996 when the U.S. Navy phased out operations, but the civilian population of Adak rebounded briefly in 1997 because of military base cleanup work. In 1998, the BOF reinstated the subsistence salmon fishery in the Adak District. From 1998 through 2007, the number of Adak District subsistence permits has ranged from one in 2006 and 2009 to 17 in 2001, for an average of 7 permits issued (Table 5).

In the past, Atka subsistence data were collected by interviews conducted by the ADF&G Subsistence Division. Due to budget reductions, the last survey was conducted in 1994 (Shaul and Dinnocenzo 2004).

SALMON ESCAPEMENT, DISTRIBUTION, AND RUN TIMING

The Aleutian Islands have runs of sockeye, coho, pink, and chum salmon. There are no known Chinook *O. tshawytscha* salmon producing streams in the Aleutian Islands. Streams on Unalaska, Umnak, Atka, Amlia, Adak, and Attu Islands produce relatively large pink salmon runs during even-numbered years (Figure 1). Tanaga, Kanaga, and Kiska Islands (Figure 1) each have at least one important pink salmon stream.

There is little salmon escapement information collected for the Aleutian Islands and Atka-Amlia Islands areas. Poor weather, remoteness, unavailability of suitable aircraft, and the high cost of aircraft charters limit surveys. The United States Energy Research and Development Administration conducted limited studies on Amchitka Island in 1977 (Simenstad et al. 1977; Valdez et al. 1977). A salmon escapement and distribution study of the entire Aleutian Island chain was conducted by the ADF&G in 1982 (Holmes 1997). The ADF&G conducted repetitive surveys on some Atka and Amlia Islands streams in 1992, 1993, and 1994 (Holmes 1995). The U.S. Fish and Wildlife Service (USFWS) conducted salmon abundance and distribution research on Adak Island in 1993 and 1994 (Palmer 1995). Foot and aerial surveys have been conducted by ADF&G on a more regular basis on some streams on Unalaska Island; however, these survey efforts have been limited. The resulting data are incomplete and of limited use in fisheries management.

In response to an oil spill from the 1997 grounding of the *M/V Kuroshima*, a weir was operated by ADF&G at Summer Bay Lake, on Unalaska Island, from 1998 through 2001 (Table 6; Figure 4; Honnold et al. 1999; McCullough 2000). The FWS has also operated a weir at McLees Lake on Unalaska Island from 2001 through 2009, and plans to continue to operate it through 2010 (Table 7; Palmer 2003; personal communication, Derek R. Hildreth, USFWS fisheries biologist). These projects documented larger runs of sockeye salmon than had been previously observed in these streams. Sockeye salmon escapements into McLees Lake increased between 2001 and 2003 when the run peaked at 101,793 fish, but then decreased to fewer than 9,000 fish in 2008 (Tables 7 and 8). Aerial surveys confirmed that the sockeye salmon escapements into McLees Lake during 2001 and 2002 were unusually large; however, in 2003 it was not possible to survey McLees Lake until September 1, at which point most of the fish had already spawned and died. Historical aerial survey information was deemed to be unreliable and did not correlate with the weir counts. No aerial surveys of McLees Lake have occurred since 2003. The sustainable escapement goal adopted in 1993 of 4,000 to 6,000 sockeye salmon for McLees Lake was eliminated in 2004 because no commercial fishery targets those stocks. Due to weak runs, the subsistence salmon fishing closed waters markers were extended by emergency order for the conservation of McLees Lake sockeye salmon in 2006, 2008, and 2009. These are the only years where subsistence harvest was restricted.

Unalaska Lake did not reach its minimum sockeye salmon peak count escapement objective of 400 fish in numerous years between 1987 and 2006 (Table 9). In 1997, the waters closed to subsistence fishing at the mouth of the stream were increased to conserve additional fish for escapement (5 AAC 01.375). Between 1998 and 2004, sockeye salmon escapements to this system have been generally adequate, but only 9 fish were documented in 2005 and 12 fish in 2006 under unfavorable survey conditions (Table 9). Surveys have not been conducted on Unalaska Lake since 2006.

2009 SEASON

The 2009 commercial salmon fishery in the Aleutian Islands and Atka-Amlia areas was managed by the ADF&G staff in Sand Point. Unalaska District salmon subsistence permits were issued by the ADF&G staff in Dutch Harbor while Adak subsistence salmon permits were issued by ADF&G in Cold Bay.

COMMERCIAL HARVEST

In 2009, the commercial harvest in the Aleutian Islands Area was 1,625,910 pink salmon (Table 1). In addition, 703 sockeye, 16 coho, and 2,005 chum salmon were harvested. The increased pink salmon harvests over the past three years have been mainly attributed to increased harvester and processor interest. All the commercial harvest was around Unalaska Island and most of that harvest occurred in the Makushin Bay area. There was no commercial salmon harvest in the Atka-Amlia Islands Area in 2009.

SUBSISTENCE AND PERSONAL USE HARVEST

A total of 215 subsistence permits were issued for the Unalaska District in 2009, which was 11 permits more than in 2008 and 14 permits more than the average from 2004 through 2008 (Table 3). The highest number of permits issued was 231 in 2002, and coincided with the peak harvest of an estimated 6,252 salmon. The total estimated harvest of 4,513 salmon in 2009 was more than the estimated 2008 catch of 3,243 fish, and more than the 2004-2008 average estimated harvest of 4,062 salmon (Table 3). An estimated 1,337 sockeye salmon, which represented 67% of the total Unalaska District harvest (1,989), were caught in Reese Bay (Table 4). The Unalaska Lake sockeye salmon harvest was an estimated 267 fish (Table 4). The 2009 total estimated sockeye salmon subsistence harvest of 1,989 fish was considerably lower than the 2004-2008 average harvest of 2,910 fish. Sockeye salmon subsistence harvests, from 2006 through 2008, were the lowest for the Unalaska District since 1996 (Table 3).

The 2009 estimated coho salmon harvest of 620 fish was more than the recent five year average (2004-2008) of 489 fish. The pink salmon subsistence harvest around Unalaska Island in 2009 was an estimated 444 fish (Table 3). Chinook and chum salmon are not abundant in Unalaska Island waters and account for only a small portion of the subsistence harvest. In 2009, an estimated 5 Chinook and 182 chum salmon were caught in the Unalaska District subsistence fishery (Table 3).

In the Adak District, one subsistence salmon permit was issued in 2009, well below the 1999-2008 average of seven permits (Table 5). The Adak estimated subsistence harvest consisted of 25 sockeye salmon (Table 5).

ESCAPEMENT

One day of aerial surveying, July 30, was conducted in the Aleutian Islands Management Area in 2009 and 160,000 pink salmon were documented in 12 Unalaska Island streams (Table 10). No foot surveys were conducted on Summer Bay creek in the Dutch Harbor vicinity (Table 10).

During 2009, the FWS again installed and operated a weir at the outlet of McLees Lake (which empties into Reese Bay) from June 1 through July 19 (Table 8; Figure 4). A total of 10,120 sockeye salmon were counted through the weir. This was the second smallest escapement documented at the McLees Lake weir since it began operation in 2001 (Table 7).

ACKNOWLEDGMENTS

The Dutch Harbor shellfish staff, especially Kathleen Herring, was very helpful in issuing and collecting subsistence permits. Dutch Harbor personnel spent considerable time enforcing subsistence fishing regulations. The technical support by Joanne Shaker, Doug Dorner, and Ric Shepard was very much appreciated. A special thanks to Todd Anderson, Iris Caldentey, Alex Bernard Jeff Wadle, and Matt Nemeth for reviewing this publication. We also thank the U.S. Fish and Wildlife Service for providing McLees Lake weir data.

Table 9.–Page 2 of 2.

Year	Peak Estimate ^a		
	Sockeye	Coho	Pink
2004	3,000	80	1,530
2005	9 ^b	35 ^b	4,212
2006	12 ^b	6 ^b	4,250
2007 ^c			
2008 ^c			
2009 ^c			
1999-2008 Average	853	50	10,016

Note: “-” = No data.

^a Estimates are based on the highest observed escapement during all surveys conducted that year.

^b Surveys not done at optimum times for all species

^c No survey conducted.
